AGENDA

- Create Readable Code
- Basic Coding Recommendations
- Developing Code

CREATE READABLE CODE

TIPS FOR CREATING CODE THAT YOU AND YOUR CO-WORKERS WILL FIND EASY TO READ AND UNDERSTAND.

1. COMMENT, COMMENT, COMMENT! WHICH COMMENT FORMAT TO USE?

Method 1:

```
/* create summary report*/
proc means data=new;
    more statements here;
run;
```

Method 2:

```
*create summary report;
proc means data=old;
    more statements here;
run;
```

Note: Method 1 may also be helpful when developing and debugging code.

1. COMMENT, COMMENT, COMMENT!

Method 1:

```
/*
data new;
    set old;
    more statements;
run;
*/
proc means data=new;
    more statements here;
run;
```

Efficiency consideration: every submission of the DATA step re-creates the SAS data.

2. USE RECOMMENDED FORMATTING FOR SAS CODE

Not this:

```
data new; set old; run;
proc means data=new;
var newvar; class year;
run;
```

Do this:

```
Data new;
   set old;
Run;

proc means data=new;
   var newvar;
   class year;
run;
```

§sas | THE POWER TO KNOW.

3. USE DESCRIPTIVE NAMES

Do this:

```
data salaryinfo2012;
   set salaryinfo2011;
   newsalary=oldsalary+increase;
run;
```

Not this:

```
data new;
   set old;
   z=x+y;
run;
```

§sas. THE POWER TO KNOW.

USE UNDERSCORES OR CAMEL CASE TO CREATE DESCRIPTIVE NAMES

Camel Case

```
data salaryInfo2015;
  set salaryInfo2014;
  newSalary=
      oldSalary+increase;
run;
```

Underscores

```
data salary_info2015;
  set salary_info2014;
  new_salary=
      old_salary+increase;
run;
```

SAS names:

- Can be 32 characters long.
- Must start with a letter or underscore, continuing with numbers, letters or underscores.
- Can be uppercase, lowercase or mixed case.
- Are not case sensitive.

5. PUT ALL "GLOBAL" STATEMENTS AT THE BEGINNING OF YOUR CODE

Libname statements, system options, and title statements are easier to find (and change, if necessary) if they are all in one place.

BASIC CODING RECOMMENDATIONS

BASIC CODING RECOMMENDATIONS TO INCREASE THE EFFICIENCY OF YOUR SAS PROGRAMS.

6. MINIMIZE THE NUMBER OF TIMES YOU READ YOUR DATA

Do this:

```
data a b c;
   set old;
   if condition then
      output a;
   else if condition then
      output b;
   else if condition then
      output c;
run;
```

Not this:

```
data a;
    set old;
    [more code]
run;
data b;
    set old;
    [more code]
run;
data c;
    set old;
    [more code]
run;
```

§.sas | THE POWER TO KNOW.

Do this:

```
proc freq data = sashelp.shoes;
table region / list out=region_freq1;
table region*product/ list out=region_freq2;
table region*stores / list out=region_freq3;
run;
```

Not only use for data processing, also use for procedures

Not this:

```
proc freq data = sashelp.shoes;
table region / list out=region_freq1;
run;

proc freq data = sashelp.shoes;
Table region*product/ list out=region_freq2;
run;

proc freq data = sashelp.shoes;
table region*stores / list out=region_freq3;
run;
```

§sas | THE POWER TO KNOW.

7. LIMIT THE NUMBER OF TIMES YOU SORT YOUR DATA

```
data new;
     infile 'rawdata.dat';
     input ID $ 1-4 name $ 5-25 salary 26-35;
run;

proc sort data=new out=new_sorted presorted;
    by ID;
run;
```

If you think the incoming data is already sorted, use the **presorted** option on your SORT statement; the sort order will be verified.

7. LIMIT THE NUMBER OF TIMES YOU SORT YOUR DATA

When creating an SQL view, avoid including an ORDER BY clause in the view, as the data will need to be sorted every time the view is used.

```
proc sql;
    create view sql.new as
        select *
            from sql.old
            order by firstvar;

proc print data=sql.new;
Run;
```

The PROC PRINT or any other procedure/Data step that uses the view will execute the stored SQL query, including the ORDER BY.

7. OVERVIEW OF SQL VIEWS

A PROC SQL view contains a stored query that is executed when you use the view in a SAS procedure or DATA step. Views are useful for the following reasons:

- Often save space, because a view is frequently quite small compared with the data that it accesses
- Shield sensitive or confidential columns from users while enabling the same users to view other columns in the same table
- Ensure that input data sets are always current, because data is derived from tables at execution time
- Hid complex joins or queries from users

Requires sorting

- DATA step with SET or MERGE and BY statements
- By statement in PROC MEANS, PROC FREQ, etc.

Does not require sorting

- PROC SQL joins
- CLASS statements in PROC MEANS, PROC FREQ, etc

8. USE IF-THEN-ELSE INSTEAD OF IF-IF-IF

Do this:

```
data new;
  set old;
  if condition then
    some action;
  else if condition then
    some other action;
  else if condition then
    some other action;
run;
```

Not this:

```
data new;
  set old;
  if condition then
    some action;
  if condition then
    some other action;
  if condition then
    some other action;
run;
```

Please note that this general recommendation relates to conditions that are mutually exclusive. If the conditions are not mutually exclusive, then further consideration is in order to see whether IF THEN ELSE is appropriate.

§sas | THE POWER TO KNOW.

9. ORDER IF THEN CONDITIONS IN DESCENDING ORDER OF PROBABILITY

```
data new;
   set old;
   if condition occurring most often then
       some action;
   else if condition then
       some other action;
   else if condition then
       some other action;
run;
```

10. SELECT ONLY THE COLUMNS YOU NEED WHEN WORKING WITH SAS DATA

Do This:

```
data new;
    set old (drop=category
        type value ...);
    more statements here;
run;
```

Not This:

```
data new;
    set old;
    more statements here;
run;
```

Variations:
- Use the keep= option if you need to keep less variables than you need to drop!
- Use both keep= and drop= options to control variables on both the incoming and outgoing sides!
- Keep= and drop= options can be used in PROC steps, too!

Do this:

```
data new;
    infile 'old.dat';
    if city='CLEVELAND';
    more statements here;
run;
```

Not this:

```
data new;
    infile 'old.dat';
    more statements here;
run;
```

§sas. THE POWER TO KNOW.

12. CONSIDER THE POSITION OF THE SUBSETTING IF

Do this:

```
data new;
    infile 'old.dat';
    if city='CLEVELAND';
    more statements here;
run;
```

Not this:

```
data new;
    infile 'old.dat';
    more statements here;
    if city='CLEVELAND';
run;
```

Subset as soon as you have all necessary values in order to prevent unnecessary creation of variables and additional processing.

§sas | THE POWER TO KNOW.

13. IF YOU ARE READING SAS DATA, USE WHERE INSTEAD OF SUBSETTING IF

Try this:

```
data new;
    set old;
  where condition;
    more statements here;
run;
```

Instead of this:

```
data new;
    set old;
    if condition;
    more statements here;
run;
```

WHERE is a pre-processor. It subsets data before it is loaded into the Program Data Vector (PFV).

Added efficiency: when using SAS/Access engines, SAS attempts to send the WHERE clause to the RDBMS for evaluation rather than to SAS;
With the IF statement, SAS must do the processing.

§sas | THE POWER TO KNOW.

IF YOU'RE GOING TO RUN A PROCEDURE ON THE DATA, USE THE "WHERE" STATEMENT IN THE PROCEDURE

Instead of this:

```
data new;
   set old;
   where condition;
   more statements here;
run;
proc means data=new;
   more statements here;
Run;
```

Try this:

```
proc means data=old;
   where condition;
   more statements here;
run;
```

§sas. THE POWER TO KNOW.

13. WHERE VS IF

WHERE and IF processing are not always 'interchangeable'

- IF processing <u>must</u> be used with:
  - Accessing raw data using INPUT statements
  - With Automatic Variables, e.g. first.variable, last.variable, _N_, etc.
  - Using newly created variables in the same DATA Step
  - In combination with data set options such as OBS =, POINT = , FIRSTOBS =
  - To conditionally execute a statement

13. WHERE VS IF

WHERE and IF processing are not always 'interchangeable'

- WHERE processing <u>must</u> be used to:
  - Utilize special operators such as LIKE or CONTAINS
  - Filter rows for input to SAS Procedures
  - Trigger use of indexes*, if available
  - When sub-setting as data set option
  - When sub-setting using PROC SQL

    *The presence of an index column on a SAS data set does not always guarantee its use in a query

13. WHERE VS IF

- WHERE and IF processing are applied differently in MERGE operations:
- With WHERE processing the sub-setting takes place <u>before</u> the MERGE operation.
- With IF processing the sub-setting takes place <u>after</u> the MERGE operation.

Be careful!

14. CONSIDER DECLARING VARIABLES AS CHARACTER WHEN THERE IS A STORAGE SAVINGS.

Consider Employee ID values similar to the following:

1015

2034

5543

6793

...

```
data new;
    input ID 1-4;
```
- ID is numeric requiring 8 bytes of storage

```
data new;

    input ID $ 1-4;
```
- ID is character requiring 4 bytes of storage

A savings of 4 bytes per observation adds up when dealing with large data!

SAS | THE POWER TO KNOW.

15. USE BUILT IN FEATURES AND FUNCTIONS

Better:

> if (upcase(a) = 'YES') then x = 1;

When testing for all possible combinations

Works:

```
if (a = 'YES' or
     a = 'YEs' or
     a = 'YeS' or
     a = 'yES' or
     a = 'yeS' or
     a = 'yEs' or
     a = 'Yes' or
     a = 'yes' ) then x = 1;
```

§sas | THE POWER TO KNOW.

15. USE BUILT IN FEATURES AND FUNCTIONS

Better:

```
Passed = sum((Q1 = 'Y'),
    (Q2 = 'Y'),
    (Q3 = 'Y'),
    (Q4 = 'Y'),
    (Q5 = 'Y'),
    (Q6 = 'Y'),
    (Q7 = 'Y'),
    (Q8 = 'Y'),
    (Q9 = 'Y'))/9 > .5;
```

No need for temporary counter

Works:

```
Counter = 0;
If (Q1 = 'Y') then counter +1;
If (Q2 = 'Y') then counter +1;
If (Q3 = 'Y') then counter +1;
If (Q4 = 'Y') then counter +1;
If (Q5 = 'Y') then counter +1;
If (Q6 = 'Y') then counter +1;
If (Q7 = 'Y') then counter +1;
If (Q8 = 'Y') then counter +1;
If (Q9 = 'Y') then counter +1;
If ((counter/ 9) > .5) then Passed=1;
Else Passed=0;
```

§sas | THE POWER TO KNOW.

15. USE BUILT IN FEATURES AND FUNCTIONS

Better:

```
My_variable = 'PASSNFAIL';
substr(My_variable,5,1) = 'Y';
```

Works:

```
My_variable = 'PASSNFAIL';
My_variable = substr(My_variable,1,4) ||
                        'Y' ||
              Substr(My_variable,6,4);
```

# 15. USE BUILT IN FEATURES AND FUNCTIONS

Types of Functions

- Character (SUBSTR, LEFT, RIGHT, UPCASE)
- Arithmetic (ABS, SUM, SQRT)
- Array (DIM)
- Date and Time (TODAY, YRDIFF, MDY, TIMEPART)
- Financial (MORT, NPV, SAVINGS
- Mathematical (LOG, EXP)
- Probability (POISSON, PROBCHI)
- Quantile, Random Number (NOMINAL, UNIFORM)
- Sample Statistics (MEAN, MIN, MAX, STD, NMISS)
- Special (LAG, PUT, INPUT)

Introduction to SAS Functions Paper
SAS 9.4 Language Reference Documentation

SAS | THE POWER TO KNOW.

16. USE CEDA WISELY

- Reading SAS 9.2 or earlier data sets in SAS 9.3 results in a translation process using CEDA (cross-environment data access)
- Because the BASE engine translates the data as the data is read, multiple procedures require SAS to read and translate the data multiple times. In this way, the translation could affect system performance.
- "Convert" SAS data sets by using PROC MIGRATE or other techniques.
If you see the following note in your log, consider using PROC MIGRATE or other techniques to convert your data to your current environment.

Note: Data file HEALTH.GRADES.DATA is in a format that is native to another host, or the file encoding does not match the session encoding. Cross Environment Data Access will be used, which might require additional CPU resources and might reduce performance.

WHEN YOU ARE DEVELOPING CODE

TIPS TO SAVE TIME AND CREATE EFFICIENT CODE

```
data complicated_program;
   set sample_data(obs=50);
   many, many, many more statements here;
run;
```

This technique may not adequately test all conditions, but will confirm the correctness of the overall program logic – and save time and computer resources!

```
data complicated_program;
   set sample_data(obs=50);
   if condition then do;
      put 'write value here' value;
      other statements to execute;
End;
run;
```

This technique allows you to test certain coding logic to
determine if conditions are met as well as variable values.

18. BENCHMARK PRODUCTION JOBS

Recommendations for benchmarking include:

- Benchmark your programs in separate SAS sessions
- Run each program multiple times and average the performance statistics.
- Use realistic data for tests.
- Elapsed time should not be used for benchmarking.

19. USE MACRO VARIABLES TO SIMPLIFY MAINTENANCE

- Use macro variables to reduce the number of changes that have to be applied manually when code needs to be updated.

This works:

```
Libname file_01 'c:\SGF_2015\project_dir\input_data';

Libname file_02 'c:\SGF_2015\project_dir\output_data';

Filename in_file1 'c:\SGF_2015\project_dir\my_text.txt';
```

This requires less Maintenance

```
%let My_Dir = c:\SGF_2015\project_dir;

Libname file_01 "&My_dir.\input_data";

Libname file_02 "&My_dir.\output_data";

Filename in_file1 "&My_dir.\my_test.txt";
```

Note the Double Quote will cause the macro variable to be resolved, and one change is applied to all three commands.

19. USE MACRO VARIABLES TO SIMPLIFY MAINTENANCE

- Use macro variables to reduce the number of changes that have to be applied manually when code needs to be updated.

This works:

```
Data array_test;
Array counters {15} var_01-var_15;

Do I = 1 to 15;
     Counters(i) = 0;
End;
```

Three changes needed
if array size changes

This requires less maintenance

```
%let max_size = 15;

Data array_test;

Array counters {&max_size} var_01 var_&max_size;

Do I = 1 to &max_size;
     Counters(i) = 0;
End;
```

Only one change here

§sas | THE POWER TO KNOW.

19. USE MACRO VARIABLES TO SIMPLIFY MAINTENANCE

- Use macro variables to reduce the number of changes that have to be applied manually when code needs to be updated.

This works:

```
Data myfile.Monthly_Data_for_2015_feb;
    Set myfile.Monthly_Data_for_2015_Jan;
Run;
```

Most people code the dates into file names

This requires less maintenance

```
%let old_month = 2015_Jan;
%let new_month = 2015_Feb;

Data myfile.Monthly_Data_for_&new_month;
    Set myfile.Monthly_Data_for_&old_month;
Run;
```

Using macro variables allows for one change at the top of the program

§sas | THE POWER TO KNOW.

20. MAKE THINGS EASIER FOR YOURSELF: EFFICIENCY ALSO MEANS WORKING SMARTER!

- Be "GREEN" – save code and reuse it later!

- Collaborate with your co-workers to share tips and suggestions

- Meet regularly to share ideas

- Some ways SAS code fosters reusability:
  - Macro library
  - Stored processes
  - User-written functions and procedures.
